

Updated 2016 6420 Head Components

Using strain gauge data acquired from the 2015 season and advanced analysis tools, Oxbo engineers have improved the strength and longevity of the rear beater posts and the cross tube. These updated features are standard on Model Year 2016 6420; existing 6420s can be upgraded to the new design.

The new beater posts feature material changes and different construction techniques that combine to reduce the stress—even in difficult picking conditions—on the parts and increase their service life. The improved construction of the cross tube also reduces stress to enhance performance.
